Drinkable skin care?

Hello fellow beauty lovers and happy Friday too!

Below is an excerpt from the press release for a new product that is a "drinkable" skin care. A product that can help reduce the signs and affects of aging from the inside out.

Interested? Keep reading! Here at Makeup University Inc we have just received a sample to test and will get back to you shortly about our experience.

Until then, please enjoy the information below or visit the TOKI website for more information.

Enjoy!

In 2002, natural Japanese beauty supplement **TOKI™** was introduced as the first collagen drink to help diminish signs of aging, and improve skin texture and appearance, literally leading women to their "fountain of youth." Of the nutritional therapies, one of the most effective approaches is oral ingestion of an absorbable collagen (TOKI), which supplies the body with the additional collagen necessary to improve skin appearance and the resulting wrinkles.

What is TOKI?

TOKI is the first natural collagen drink clinically shown to reduce fine lines and age spots. Introduced to the United States by way of Japan in 2002, TOKI has become a leader in the field of natural beauty aids. In Japan, TOKI was used to support the joints, due to the effect active collagen and glucosamine has on the joints. Soon after it was introduced, clients began to report an overall improvement in the texture and appearance of their skin.

TOKI contains three essential nutrients for the skin: Active Collagen, Calcium and Mucopolysaccharide, which is a group of polysaccharides that are a constituent of bone and other connective tissues. Mucopolysaccharides include hyaluronic acid which is normally produced by the body and gives the skin its volume, fullness and elasticity. TOKI is taken internally in the form of an eight-ounce drink and delivers the essential nutrients to the dermis layer of the skin through the body's own blood supply.
